Step 1. Sign in

> KDL OS must already be installed and running. If not, follow the **Installation** guide first (Admin > Documents > Installation).

Open **http://localhost/login**. Email `admin@kdl.com`, password `kdl-dev-seed-password`. KDL OS asks you to choose a new password on first sign-in.

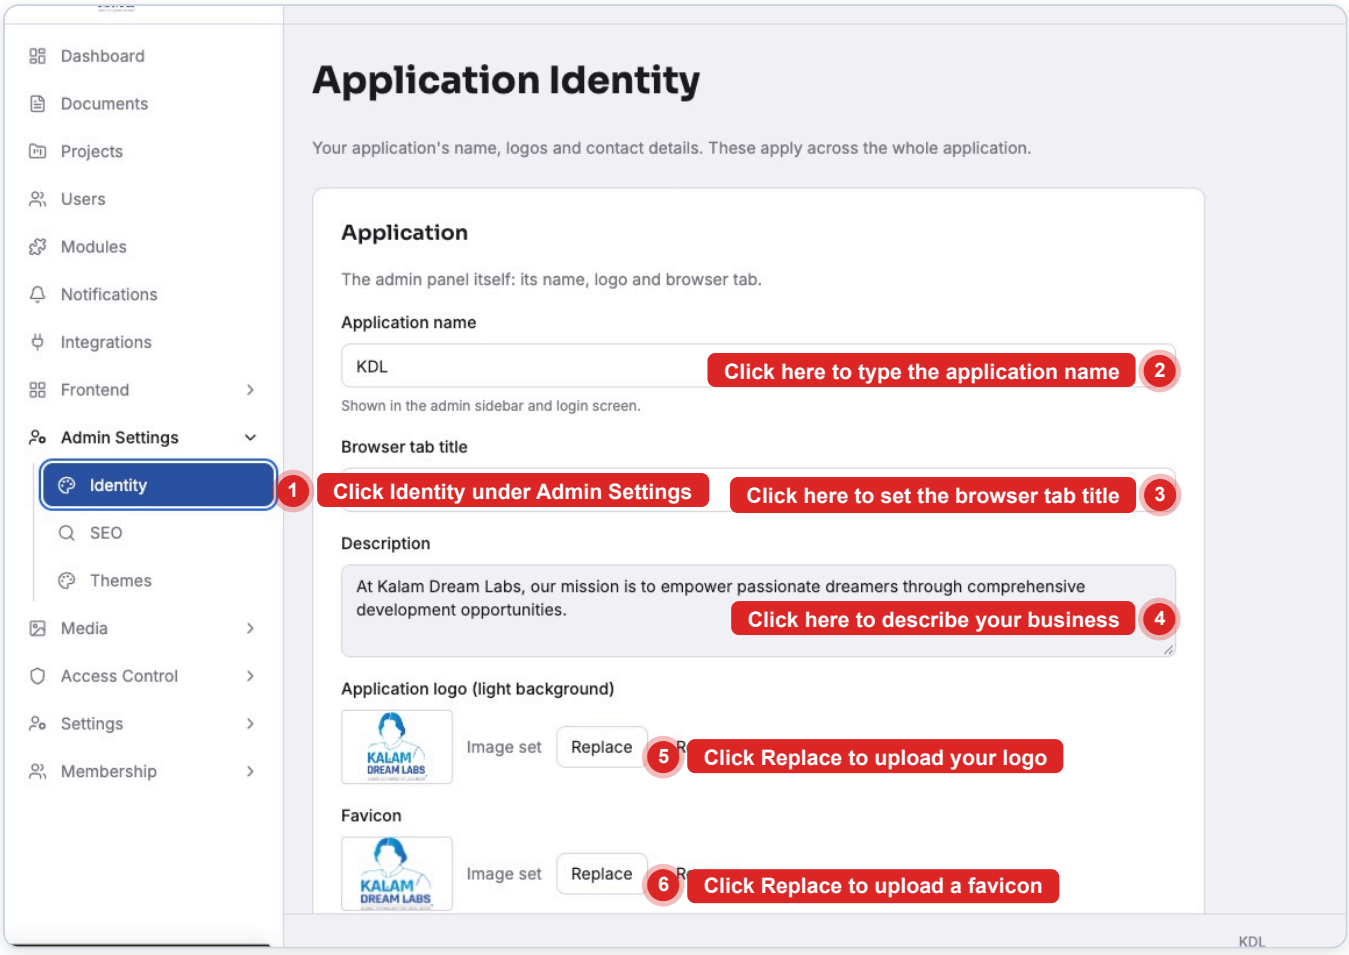

The sign-in screen

> Forgot the password or locked out? `docker compose exec backend node scripts/reset-admin-password.js --email admin@kdl.com --password 'Admin@123'` (at least 8 characters), then sign in with it. 429 or "Account locked" while testing: wait a minute or `docker compose restart backend`.

Step 2. Open Application Identity

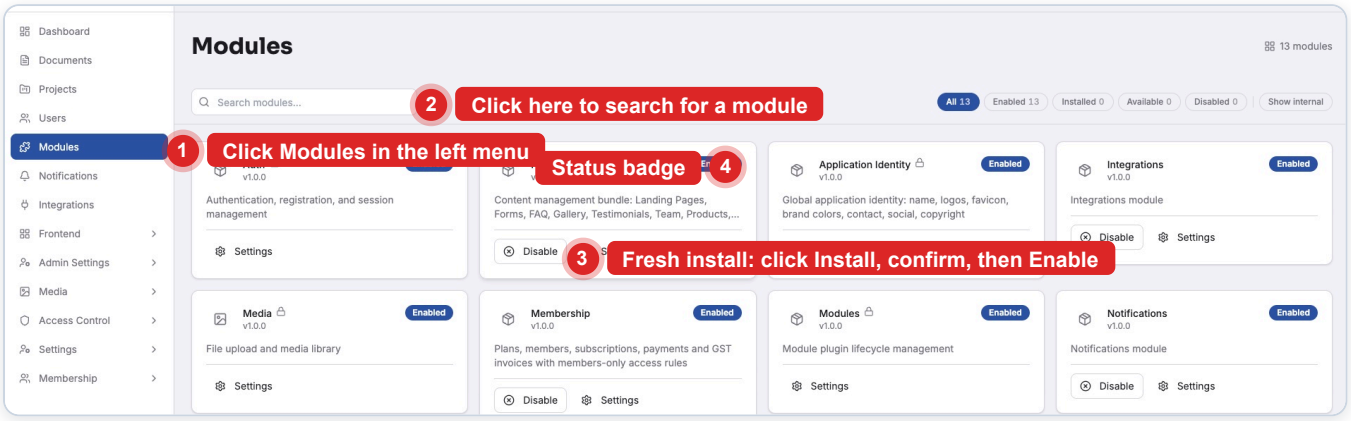

After you sign in, open **Admin Settings > Identity** in the left menu. This is where the application name, logo and favicon are set.

Admin Settings > Identity

Step 3. Open Modules, install and enable Frontend

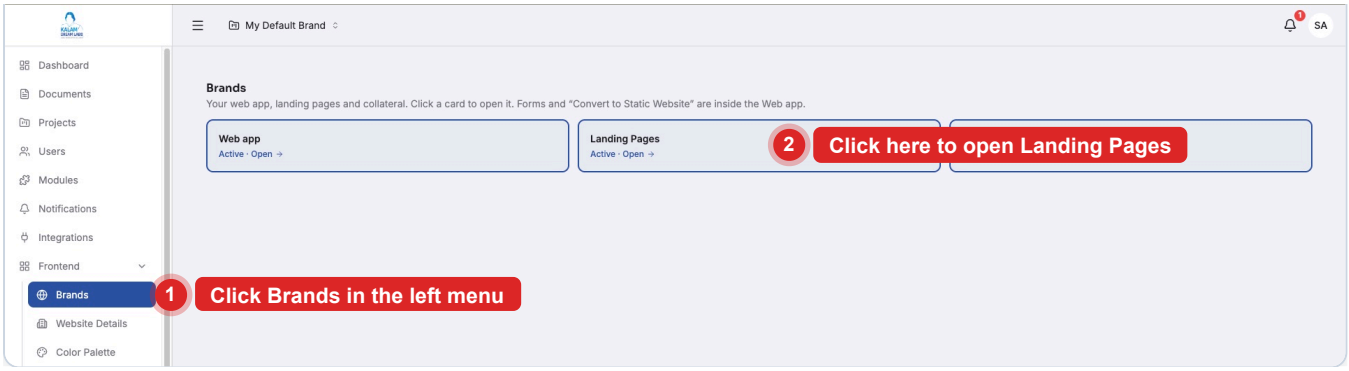

Click **Modules** in the left menu. Find the **Frontend** card (use the search box if you need to). On a fresh install the card shows **Install**: click it and confirm, then click **Enable** and confirm. The badge changes to **Enabled**.

Modules: the Frontend card

Step 4. Click Brands and select Landing Pages

Click **Frontend > Brands** in the left menu. Three cards appear: Web app, Landing Pages and Collateral. Click the **Landing Pages** card to open it.

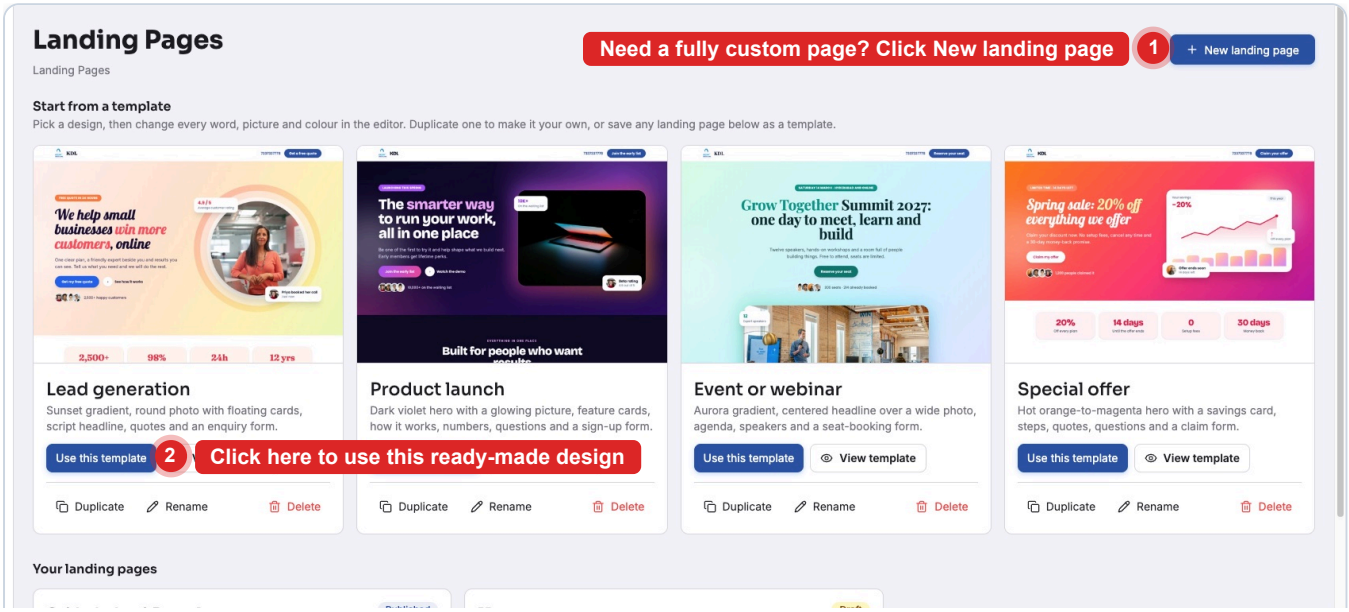

Brands: click the Landing Pages card

Step 5. Choose a landing page template

Open **Landing Pages** (http://localhost:3001/admin/landing-pages). Ready-made designs are already listed under **Start from a template**: Lead generation, Product launch, Event or webinar and Special offer. Click **View template** to preview one, then click **Use this template** to start from it. Every word, picture and colour can be changed afterwards in the editor.

If you need a fully custom page, click **New landing page** instead. This guide follows the template route.

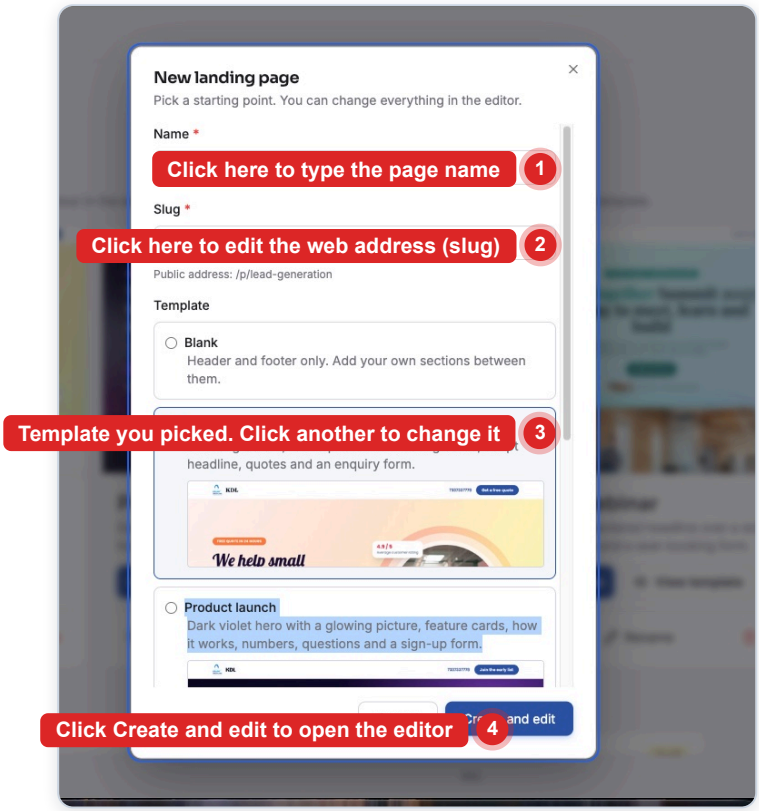

Landing Pages: start from a template

Step 6. Name the page and create it

A **New landing page** window opens with the template you picked already selected. Fill in two things, then continue:

- **Name**: the title you see in the admin, for example "Summer offer".
- **Slug**: the last part of the public web address. The page will be published at `/p/<slug>`; the full address is shown under the field.

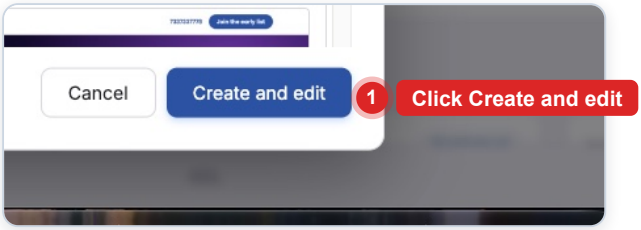

To use a different design, click another option under **Template** (choose **Blank** for a page with only a header and footer). Then click **Create and edit** to open the page in the editor.

New landing page window

Step 7. Click Create and edit, then change the page

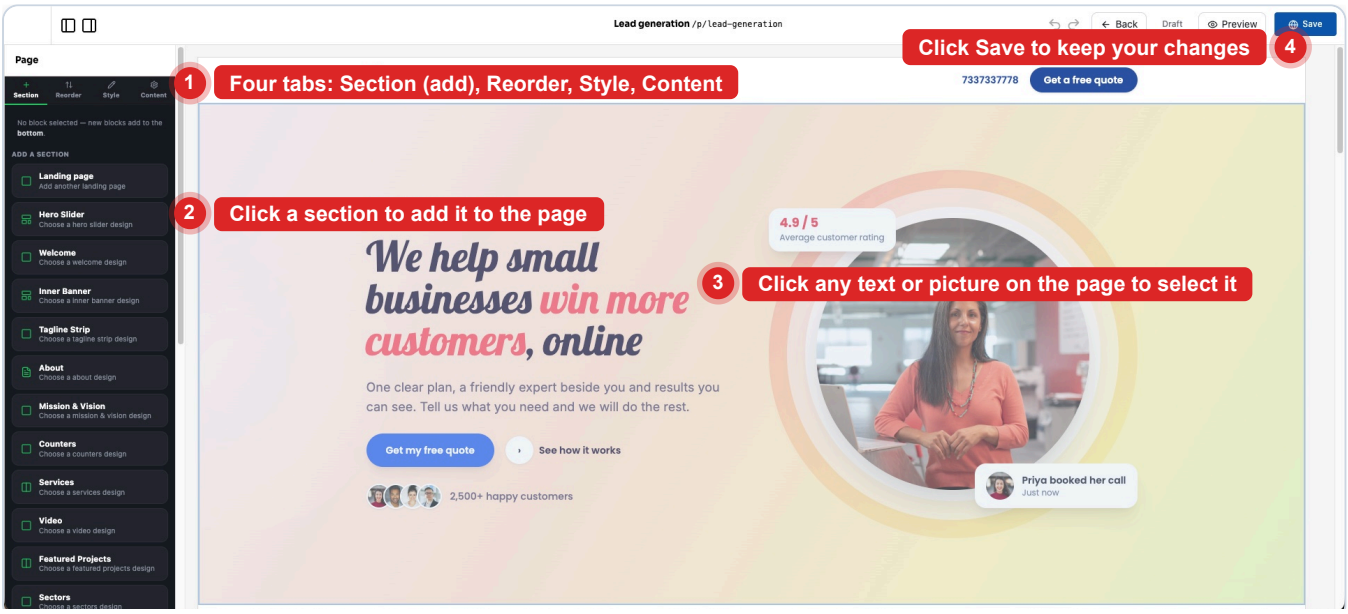

Click **Create and edit**. The page opens in the editor.

Click Create and edit

Change the page like this:

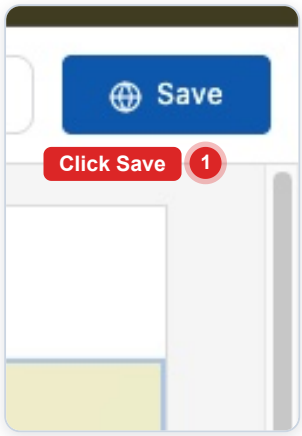

- **Content and images:** click a block on the page, then use the **Content** tab to change its text, replace its picture and edit its links (for example a button's address).
- **Look (UI):** use the **Style** tab for colours, fonts and spacing.
- **Sections:** use the **Section** tab to add sections from the list (Hero Slider, Welcome, Services and more) and the **Reorder** tab to move them. This is the section builder.
- **SEO:** the editor has no SEO button. Set the page title and description defaults in **Admin Settings > SEO**.
- Click **Preview** to see the page, then **Save**. The page stays a **Draft** until you publish it.

The landing page editor

Step 8. After editing, click Save

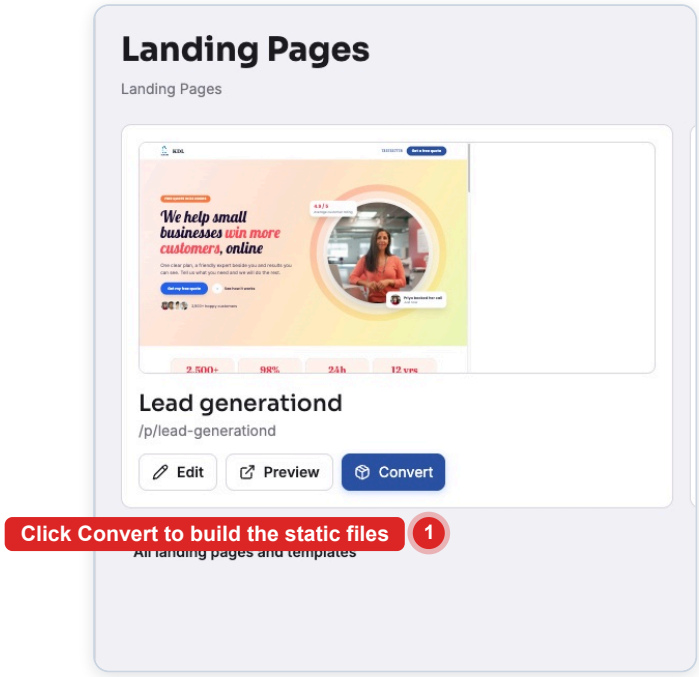

When you have finished all your changes, click **Save** at the top right of the editor. Your changes are stored and the page stays a **Draft** until you publish it. Then go back to the **Landing Pages** list (http://localhost:3001/admin/landing-pages).

Click Save

Step 9. Click Convert

In the **Landing Pages** list your page now has three buttons: **Edit**, **Preview** and **Convert**. Click **Convert**. KDL OS builds your page as plain static files. This takes a few minutes; you can stay on the page. When it finishes, the card says **Moved to its folder. Ready to host.** and shows the folder name.

Landing Pages: click Convert

Step 10. Copy the static files and host them on GitHub

The static files are in the folder shown on the card (inside your project, under `frontend/projects/`, in the `out` folder). You can also click **Download as .zip** on the card and unzip it. The files inside, with `index.html` at the top, are your finished landing page. Edit the page, Save and Convert again at any time: the same folder is updated.

To host the files on GitHub:

1. On GitHub create a new empty repository, for example `my-landing`.
2. Copy the files from the folder into a new folder, open a terminal in it, and run (use your own username and repository name):

```
TERMINAL
git init
git add .
git commit -m "Landing page"
git branch -M main
git remote add origin https://github.com/YOUR-USERNAME/my-landing.git
git push -u origin main
```

3. On GitHub open the repository, then **Settings > Pages**. Under **Build and deployment** choose **Deploy from a branch**, pick the **main** branch and the **/ (root)** folder, then **Save**.
4. After a minute your page is live at `https://YOUR-USERNAME.github.io/my-landing/`.

Notes: Changes after the page is live

This is not a step. Use it later, when a client asks for a change some days after you hosted the files.

1. Open the **Landing Pages** list directly: http://localhost:3001/admin/landing-pages?finished=1
2. Find the page and click **Edit**. The editor opens.
3. Make the changes with the section builder (text, images, links, sections, style).
4. Click **Save**.
5. Go back to the **Landing Pages** list and click **Convert** again. The new files are written into the **same folder** as before, replacing the old files.
6. Copy the updated files into your GitHub repository folder (replace the old files), then push them to the server:

```
TERMINAL
git add .
git commit -m "Update landing page"
git push
```

7. Wait a minute. GitHub Pages shows the updated page at the same address.

> You never create the page again. Edit, Save, Convert and push is the whole routine for every change.
