Flow 2: Landing page only (with admin)

Goal: publish one or more campaign pages without a full website.

You get: branded landing pages at `/p/<slug>` with a working contact form, plus the admin that runs them.

Product	Turns on	Typical use
Admin (always on)	Users, Roles, Settings, Identity, Media	Internal business app
Website	Content, Menus, Page builder, Theme engine, Media	Multi-page company site
Landing Pages	Landing, Page builder, Theme engine, Media	Campaign and product pages

1. Sign in and run the first-time setup

1. Open **http://localhost:3001/login** and sign in with your admin account.
2. On a fresh install the **Setup wizard** opens by itself.
   - **Step 1 of 2: company details.** Name, logo, emails, phones, address. Saved once in **Settings > Identity** and reused everywhere (admin, website, print layouts).
   - **Step 2 of 2: what are you building?** Tick the products you need (see the table below). Admin is always on. The screen shows what each choice turns on before you press **Apply products**.
3. Missed the wizard? Company details live in **Admin Settings > Identity**; products live at **/admin/settings/products**. Turning a product off never deletes data.

Tick **Landing Pages** (leave Website off). There is no website setup step.

2. Set the brand once

Admin Settings > Identity for name, logo, contacts. **Admin Settings > Themes**, choose **Website**, pick colours and fonts, **Publish**. Landing pages use these tokens.

Build a landing page

1. **Frontend > Brands**, choose **Landing Pages** (or open **/admin/landing-pages**).
2. Pick a template and press **Use this template** (or **View template** first). Give the page a name and press **Create and edit**.
3. In the editor change text, images, buttons and the contact form block. Use **Insert block** for more sections and **Sections** for saved ones.
4. **Save**. The finished pages list shows each page with **Preview** and **Convert**.

5. **Publish** when the checks pass. The page is public at `/p/<slug>`.
6. Optional: set the page's own branding (logo, colours), duplicate, rename, or **Save as template**.
7. Forms: create the form under **Frontend > Brands > Forms**, then pick it in the Contact Form block. Messages land in the admin.

Admin application (always included)

Everything below is available from the first sign-in and does not depend on any website product.

Need	Where
Add people	**Users** (add, suspend, reset)
Decide who can do what	**Access Control > Roles / Permissions** (Super Admin, Developer, Admin, User defaults)
Company name, logo, contacts	**Admin Settings > Identity**
Admin look (colours, fonts)	**Admin Settings > Themes**, choose **Admin app**, Simple or Advanced, **Publish**
Turn capabilities on or off	**Modules** (a module that is off has no menu entry)
Alerts and integrations	**Notifications**, **Integrations**
Who did what	**Access Control > Activity Log**
Files	**Media > Library**; storage under **Settings > Storage**

Check it worked

- Open the public address in a private window, signed out.
- Header, top bar and footer match Home on every page.
- Every menu link opens a page; forms send (Web app) or show your contact details (static).
- Admin sidebar shows only the modules your products need.
