Flow 5: Web app, landing pages and admin

Goal: a full website plus separate campaign pages, all under one admin.

You get: the live website, landing pages at `/p/<slug>`, one shared brand, one admin.

Product	Turns on	Typical use
Admin (always on)	Users, Roles, Settings, Identity, Media	Internal business app
Website	Content, Menus, Page builder, Theme engine, Media	Multi-page company site
Landing Pages	Landing, Page builder, Theme engine, Media	Campaign and product pages

1. Sign in and run the first-time setup

1. Open **http://localhost:3001/login** and sign in with your admin account.
2. On a fresh install the **Setup wizard** opens by itself.
   - **Step 1 of 2: company details.** Name, logo, emails, phones, address. Saved once in **Settings > Identity** and reused everywhere (admin, website, print layouts).
   - **Step 2 of 2: what are you building?** Tick the products you need (see the table below). Admin is always on. The screen shows what each choice turns on before you press **Apply products**.
3. Missed the wizard? Company details live in **Admin Settings > Identity**; products live at **/admin/settings/products**. Turning a product off never deletes data.

Tick **Website** and **Landing Pages**.

Build the website (Web app)

The Web app is the live website served by this installation, from the same address as the admin.

1. **Frontend > Brands**, choose **Web app** (the Studio / Template Engine). First time: press **Start Studio run**.
2. **Overview**: upload the logo, confirm company and contact details, **Next**. The logo also becomes the admin logo.
3. **Color Palette**: four brand colours are taken from the logo. Keep or edit them (hex, Randomize, eyedropper), **Submit palette**.
4. **Approval**: the brand kit is approved by a person; the colours become design tokens in the Theme Engine.
5. **Website stage** (Brands > Web app): **Typography**, **Font settings**, optional **Buttons and form fields** style, **Navigation** (one page per menu item, plus Home), then **Pages** to assemble them.

6. **Layouts**: pick the Top header, Header and Footer designs. Home's header and footer are shared by every public page.
7. **Fill the content**: Sectors, Catalog, Work, FAQ, Case Studies, Team, Testimonials, Gallery. Each Sector, Catalog and Work entry gets its own detail page.
8. **Navigation** (menus): fine-tune header and footer menus. No re-run needed.
9. **Pages / page editor / Sections**: edit blocks, **Publish**. Publish checks stop real problems (empty page, missing title, broken link, image without source) and only suggest the rest.
10. **Go live**: pages are public at `/`, `/p/<slug>`, `/sectors/<slug>`, `/catalog/<slug>`, `/work/<slug>`.

After a change, re-run only what changed: logo or contacts: save Overview. Navigation: Navigation then Pages. Header or footer design: Layouts. Colours or fonts: Color Palette or Typography, Approval, then re-run Website. Entry text or menus: edit in place.

Build a landing page

1. **Frontend > Brands**, choose **Landing Pages** (or open **/admin/landing-pages**).
2. Pick a template and press **Use this template** (or **View template** first). Give the page a name and press **Create and edit**.
3. In the editor change text, images, buttons and the contact form block. Use **Insert block** for more sections and **Sections** for saved ones.
4. **Save**. The finished pages list shows each page with **Preview** and **Convert**.
5. **Publish** when the checks pass. The page is public at `/p/<slug>`.
6. Optional: set the page's own branding (logo, colours), duplicate, rename, or **Save as template**.
7. Forms: create the form under **Frontend > Brands > Forms**, then pick it in the Contact Form block. Messages land in the admin.

How the two fit together

- Both use the same Identity, Themes and Media.
- The website's header and footer come from Home. Landing pages keep their own footer and have no menu unless you add one.
- Link between them with normal links, for example a menu item **Offerl/p/summer-offer**.

Admin application (always included)

Everything below is available from the first sign-in and does not depend on any website product.

Need	Where
Add people	**Users** (add, suspend, reset)
Decide who can do what	**Access Control > Roles / Permissions** (Super Admin, Developer, Admin, User defaults)
Company name, logo, contacts	**Admin Settings > Identity**
Admin look (colours, fonts)	**Admin Settings > Themes**, choose **Admin app**, Simple or Advanced, **Publish**
Turn capabilities on or off	**Modules** (a module that is off has no menu entry)
Alerts and integrations	**Notifications**, **Integrations**
Who did what	**Access Control > Activity Log**
Files	**Media > Library**; storage under **Settings > Storage**

Check it worked

- Open the public address in a private window, signed out.
- Header, top bar and footer match Home on every page.
- Every menu link opens a page; forms send (Web app) or show your contact details (static).
- Admin sidebar shows only the modules your products need.
