Flow 7: Web app and static website together

Goal: keep the live site and also publish a plain-file copy.

You get: a live web app for editing and forms, plus a static copy for fast public hosting.

Product	Turns on	Typical use
Admin (always on)	Users, Roles, Settings, Identity, Media	Internal business app
Website	Content, Menus, Page builder, Theme engine, Media	Multi-page company site
Landing Pages	Landing, Page builder, Theme engine, Media	Campaign and product pages

1. Sign in and run the first-time setup

1. Open **http://localhost:3001/login** and sign in with your admin account.
2. On a fresh install the **Setup wizard** opens by itself.
   - **Step 1 of 2: company details.** Name, logo, emails, phones, address. Saved once in **Settings > Identity** and reused everywhere (admin, website, print layouts).
   - **Step 2 of 2: what are you building?** Tick the products you need (see the table below). Admin is always on. The screen shows what each choice turns on before you press **Apply products**.
3. Missed the wizard? Company details live in **Admin Settings > Identity**; products live at **/admin/settings/products**. Turning a product off never deletes data.

Tick **Website**.

Build the website (Web app)

The Web app is the live website served by this installation, from the same address as the admin.

1. **Frontend > Brands**, choose **Web app** (the Studio / Template Engine). First time: press **Start Studio run**.
2. **Overview**: upload the logo, confirm company and contact details, **Next**. The logo also becomes the admin logo.
3. **Color Palette**: four brand colours are taken from the logo. Keep or edit them (hex, Randomize, eyedropper), **Submit palette**.
4. **Approval**: the brand kit is approved by a person; the colours become design tokens in the Theme Engine.
5. **Website stage** (Brands > Web app): **Typography**, **Font settings**, optional **Buttons and form fields** style, **Navigation** (one page per menu item, plus Home), then **Pages** to assemble them.

6. **Layouts**: pick the Top header, Header and Footer designs. Home's header and footer are shared by every public page.
7. **Fill the content**: Sectors, Catalog, Work, FAQ, Case Studies, Team, Testimonials, Gallery. Each Sector, Catalog and Work entry gets its own detail page.
8. **Navigation** (menus): fine-tune header and footer menus. No re-run needed.
9. **Pages / page editor / Sections**: edit blocks, **Publish**. Publish checks stop real problems (empty page, missing title, broken link, image without source) and only suggest the rest.
10. **Go live**: pages are public at `/`, `/p/<slug>`, `/sectors/<slug>`, `/catalog/<slug>`, `/work/<slug>`.

After a change, re-run only what changed: logo or contacts: save Overview. Navigation: Navigation then Pages. Header or footer design: Layouts. Colours or fonts: Color Palette or Typography, Approval, then re-run Website. Entry text or menus: edit in place.

Convert the website to a static website

A static website is plain files (HTML, CSS, images) you can host anywhere, with no server.

1. Finish and publish the website pages first (see the Web app steps). The export holds the **published** pages.
2. Open **Frontend > Convert to Static Website** (**/admin/static-website**).
3. Optional **Website address** (for example https://www.example.com): adds `sitemap.xml` and canonical addresses. `robots.txt` and each page's title, description and share tags are always included.
4. Optional **Web app address**: a static site has no server, so forms cannot save messages on their own. Leave it empty and each form is replaced by your contact email and phone from Identity. Enter your public Web app address and forms, menus and FAQ keep working through it. It must be an https address.
5. Press **Convert to Static Website**. Progress: collect pages, menus, brand and images; build the files; ready to host. It takes a few minutes.
6. Press **Download as .zip**, unzip, and upload to any host (Netlify, S3, shared hosting, your own nginx).
7. Changed something later? Press **Convert again with the latest changes**.

A landing page converts the same way from its own **Convert** button; each landing page gets its own folder.

Running both

- The Web app stays the **source of truth**: edit and publish there.
- Public traffic goes to the static copy; set its **Web app address** so forms, menus and FAQ call back to the live app.
- Re-convert after publishing changes. The static copy never edits itself.

Check it worked

- Open the public address in a private window, signed out.
- Header, top bar and footer match Home on every page.
- Every menu link opens a page; forms send (Web app) or show your contact details (static).
- Admin sidebar shows only the modules your products need.
